PhD position in Systems Biology
Computational Biology & Biological Physics

The Computational Biology & Biological Physics group at Lund University is recruiting a PhD student in the area of dynamical modelling of biological networks, in particular in relation to network evolution. Primary biological topics to be addressed are the evolutionary origins and design principles of circadian clocks, but the computational tools and programs to be developed may also be applied to stem cell regulation and other biological systems.

Successful candidates should have a bachelor’s degree plus an additional full year of advanced-level courses in computational biology, physics, applied mathematics, bioinformatics, computer science or engineering. Candidates willing to work in an exciting environment on the cutting edge of systems biology and biophysics are encouraged to apply. Applications including a CV, a brief description of research interests and the name of two references are due February 14, 2011, should be sent via the application system from:
